The label said
OpenAI.

Who's been asked “Are we using any
Chinese AI?”

Keep your hand up if you had a clean answer.

It's the bill.

Most of the best open-weight models come from Chinese labs.

Quantitative trading firm

Self-hosting

Open-weight model on cloud GPUs

At their usage, GPU cost ate into the savings

Large logistics company

One of ours

Frontier model, one customer

300+ conversations in 12 months

Under \$300 in tokens

Coder's support agent

Price each workload. Then tier.

“Cybersecurity was like, no.”

Engineer, large logistics company

zip code

schools

who lives next door

None of it tells you what's behind the drywall.

The neighborhood: where it
was trained, whose flag

THE MODEL AS A HOUSE

Three layers

WIRING

What got baked in before you
moved in

CONTRACTOR

What they left behind when they
handed you the keys

DOORS

What can get in, and what can get
out

LAYER 1 OF 3

Wiring

A planted backdoor survived safety training.

~250 poisoned documents planted a backdoor. Same number at every model size tested.

Research scanners catch most. Most isn't all.

Contractor

Some model files run code when you load them.

~100 malicious models found

The fake repo: malware in the script next to the model.

It runs on the laptop that's logged into everything.

Contractor

Some model files run code when you load them.

~100 malicious models found

The fake repo: malware in the script next to the model.

It runs on the laptop that's logged into everything.

“The resources of a pocket calculator.”

Investment firm, on developer laptops

If you pull from a public hub

01 **Use safetensors.**

It's just the numbers. It can't run code.

02 **Pin an exact commit.**

The model you tested is the model you run.

03 **Leave** `trust_remote_code` **off**

The library won't run the repo's own Python.

Doors

Does my data leave?

Approved models. Approved providers. Approved gateways. MCP servers too.

Investment firm

Self-hosting gives you the chance. The work is yours.

Block outbound. Allow what's approved. Watch what leaves.

Doors

MCP servers too.

Investment firm

Self-hosting gives you the
chance. The work is yours.

Block outbound. Allow what's approved.
Watch what leaves.

Doors also limit
what a model can
do.

Our agent didn't need to
open pull requests. We
closed that door.

Contain the agent. Watch
the network.

Trading firm

Where do bans fit?

Fair reasons

A hosted service that ships data overseas

A customer contract that requires it

What a ban doesn't touch

The wiring

The contractor

A poisoned American model

Where do bans fit?

A hosted service that ships data overseas

A customer contract that requires it

What a ban doesn't touch

The wiring

The contractor

A poisoned American model

The list moves. 2026: first U.S. company designated a supply chain risk.

If that letter landed Monday, could you
tell me by Friday everywhere that model
runs?

If that letter landed Monday, could you tell me by Friday everywhere that model runs?

“I had no idea we were doing that.”

Consumer software company

“If model A is not available, route to model B.”

Financial services firm

Every water heater dies. Don't pour concrete around it.

The model is the water heater.

How we run it at Coder

Agents

Changes every quarter

Workspaces + one gateway

Models

Valves and connectors

Valves and connectors

No laptops touched.

WIRING

Can you verify what's baked in?
Not fully. Build for the swap.

CONTRACTOR

Do you control how it loads?
If it can run code, treat it like code.

DOORS

What can get in and out?
Close what it doesn't need.

Homework: answer the Friday question for one model this week.

“Figuring out what the hybrid looks like, we're still not there yet.”

Hedge fund

Solved model intake or swapping at scale? Find me. I want to steal it.
